

### Final 3 App Ideas:

- 1) Keeps track of your beestro purchases for you to see  
Currently, students have to wait until their parents get a bill to know how much money they've spent at the Beestro. Some students probably aren't even aware of how much money they spend each week, and they could benefit from being able to see their purchases. Having an app that could automatically put the charges that go onto your account onto an app on your phone would be very helpful.
- 2) Compares prices of gas at nearby gas stations  
Often times in towns there are several gas stations within very short distance from each other. This app could compare the prices of gas stations within about a mile or less and show the app user which gas station they should go to for the cheapest price. The user could also select a location and see the best gas price in that area, instead of just seeing the compared prices of their current location.
- 3) Multiple timers for when you're cooking with labels of what each timer is for  
This app with multiple timers would be useful when cooking a meal that has several components cooking at the same time. It is often difficult to keep track of which food is done cooking/baking when. Having multiple timers with labels could keep track of this and remind you which food is done.
